Watson Assistant Solutions provides documentation and functions to help protect your data.

Important For information about responsibilities relating to personal data, see the [Notice regarding personal data](#) topic.

Protecting your data when using Watson Assistant Solutions

You can control the logging of personal information (PI) for your Watson Assistant Solutions tenants. When disabled, any statements that are logged for your tenants do not contain personal information. The logging of PI data is enabled by default. For more information, see the [Logging of personal information](#) topic.

User data is sent to Watson Assistant Solutions services through REST APIs. If a user revokes their consent, use the relevant API endpoint to remove personal information.

The Context REST API is used to store information about users in the skill and session contexts. To remove user data, use these endpoints:

- `DELETE /context/{userId}`
- `DELETE /context/{userId}/{skillName}` (call for each registered skill)

The Knowledge REST API is used to store information about the world around users to add proactivity to assistants. To remove user data, use these endpoints to remove objects and object relations from the world model:

- `DELETE /knowledge/object/{objectId}`
- `DELETE /knowledge/relation/{relationId}`

The Profile REST API is used to store profile information about users. To remove user data, use these endpoints to remove email addresses and phone numbers:

- `DELETE /profile/email/{userId}`
- `DELETE /profile/phone/{userId}`
